

OBJECT ORIENTED PRINCIPLES.

Lab02_Group_A: A First Java Application.

On this lab a simple Java application is proposed.

- The folder **src** contains the code of the Java application.
 - o MyMain.java => This class tests the functionality of Lab02_Group_A. This class is provided completed, so you must not modify it.
 - o Module.java => Our first pure Object Oriented Programming Java class, modelling the concept of a university module. You must complete this class.
- The folder **javadoc** contains the documentation of the Java application.
 - o MyMain.html => This file contains the description of the class MyMain.java.
 - o Module.html => This file contains the description of the fields, constructor, get methods, set methods and extra functionality of the class Module.java. Use this file to guide you in completing the code of the file Module.java.
- The folder **results** contains the expected results of the Java application.
 - o result.txt => This file contains the output obtained from running the lecturer's solution when running the main method of MyMain.java. That is, when the Java application is used to test the functionality of the class Module.

Actions:

1. Create a new project using the IDE and import the files MyMain.java and Module.java into it.
2. Complete the code of the class Module.java. The fields, constructor, get methods, set methods and extra functionality must follow the description given by the Javadoc file Module.html (the file Module.pdf is also provided, just in case you cannot see well the html file).
3. Use the file results.txt to compare the results to the expected ones.
